OBJECTIVE OF WORKSHOP

Dysphagia, or difficulty in swallowing, is a common concern among adults and the elderly, particularly those affected by neurological conditions such as stroke, Parkinson's disease, dementia, and head and neck cancers. When left untreated, dysphagia can result in serious complications including aspiration pneumonia, malnutrition, dehydration, and a marked decline in quality of life. Early identification and evidence-based intervention are critical to ensuring safe swallowing and improving overall health outcomes.

This one-day RCI-CRE workshop is designed to equip clinicians with comprehensive knowledge and practical skills in the assessment and management of dysphagia in adult and geriatric populations. Through expert talks and interactive case-based discussions, the program aims to empower participants with tools to achieve clinical excellence and enhance patient care in dysphagia management.
